

# Configuring Swing Eagle to Suit Your Body

This is done in two parts. The first is just a rough configuration and the second is to make adjustments that will permit Swing Eagle to suit your body exactly.

## PART A: Rough configuration

1

Check that the two Sliding Height Adjusters are set to the 6th hole. If not, slide upwards and place the pins in the 6th hole on both sides.

2

Set the hoop angle at 70°. Ensure the angle aligns with the slot.

3

Set the Sliding Bracket in the middle of the Radius Adjuster Arm. In order to enable it to slide, the 2 Spring Loaded Side Tabs must be held outwards.

## PART B: Configure Swing Eagle to suit you...

1

**Set your swing radius:** Grip your club and, keeping your head still, take a half backswing.

**Shorter players** will find that the Midway setting, pulls you to the right and therefore you must **DECREASE** the radius by moving the Club Holder Sliding Bracket upwards. **Medium height players** may find that the **Midway setting is ok**. **Taller players** will find that you must **INCREASE** the radius by moving the Club Holder downwards.

When you have done this make a half through swing. You will have the correct setting when you feel that your swing is neither cramped, nor wanting to pull you laterally one way or the other. You can fine tune this after the next two steps.

2

The club head is ideally about 40mm off the floor. Do this by adjusting the Sliding Height Adjuster. The pins sit **under** the Sliding Height Adjuster.

3

You should now be able to take your normal stance because the club will be positioned as it would be if you're playing a shot, the only difference being that it is 40 mm off the floor. If the floor is concrete we suggest that you place a piece of carpet on the floor in case the club comes into contact with the floor.

Remember that you can continue to make small adjustments to suit your frame and your swing as you become more familiar with Swing Eagle after following closely our teaching instructions on the Swing Eagle website.
